

**17.** At least one computer-readable medium encoded with instructions that, when executed by a processor, perform:

determine that, at least a part of, content of a section of a document is being displayed;

determine at least one character identity, the character identity being pertinent to content of the section;

determine at least one location identity indicated by the section, the location identity being indicative of a location of a character indicated by the character identity; and

determine at least one visual representation of the location identity such that the visual representation of the location identity comprises a visual representation of the character identity that indicates a relationship between the character identity and the location identity.

**18.** The medium of claim **17**, further encoded with instructions that, when executed by a processor, perform:

causation of display of the visual representation of the location identity; and

receipt of information indicative of a document browsing input, wherein the causation of display of the visual representation of the location identity is based, at least in part, on the document browsing input.

**19.** The medium of claim **17**, further encoded with instructions that, when executed by a processor, perform:

determination of at least one other character identity, the other character identity being pertinent to content of the section and being different than the character identity; and

determination of at least one other location identity indicated by the section, the location identity being indicative of a location of a character indicated by the character identity, wherein the visual representation of the location identity comprises a visual representation of the other location identity such that the visual representation of the other location identity comprises a visual representation of the other character identity that indicates a relationship between the other character identity and the other location identity.

**20.** The medium of claim **17**, further encoded with instructions that, when executed by a processor, perform:

determination that, at least part of, a different section of the document is being displayed;

determination of at least one other character identity, the other character identity being pertinent to content of the different section;

determination of at least one other location identity indicated by the different section, the other location identity being indicative of a location of a character indicated by the other character identity; and

determination of at least one visual representation of the other location identity such that the visual representation of the other location identity comprises a visual representation of the other character identity that indicates a relationship between the other character identity and the other location identity.
